SPPH 400 (Traditional) – Statistics for Health Research
Course Syllabus 2017

DAYS & TIMES: Tuesday/Thursday: 12:30 p.m. – 2:00 p.m.

LOCATION: Tuesdays: AERL 120, Thursdays: FRDM 153

INSTRUCTORS: Mike Marin, Lianping (Mint) Ti

EMAIL: mike.marin@ubc.ca, mintti@cfenet.ubc.ca

OFFICE: Mike - Room 263, SPPH Building, UBC
Mint – Room 610, BC Centre for Excellence in HIV/AIDS, St. Paul’s Hospital

OFFICE HOURS: Office hours will be posted on the course website. The instructors will hold a combination of set-times for office hours as well as set appointments. After lectures, both instructors will often be available to meet. The TA will also hold a ‘workshop’ session where students may ask questions.

DISCUSSION BOARD: The course website has a discussion board for posting questions, etc. Please post all (non-personal) questions related to the course here. Others will benefit from seeing your question, and the answer to it. The discussion board will be monitored by the instructors and TA, although students are encouraged to answer each others questions.

TEACHING ASSISTANTS: The teaching assistant(s) (TA) for this course will be introduced at the beginning of the course. The TA will offer a workshop session where students may ask questions about the in-class activities, or any other questions related to the weeks material. They will also offer some support for the statistical software R. They will assist in the grading of assignments and examinations. Schedules for the workshop and office hour(s) can be found in a separate document posted on the website.

COURSE PHILOSOPHY AND OBJECTIVES:

This course will introduce students to basic statistical methodology used in health research. By the end of this course, students will be able to:

1. Choose and create effective graphical, tabular, and numerical summaries of univariate and bivariate data.

2. Distinguish between basic methods for selecting samples and understand the impact of the sampling method on the choice of statistical analysis and generalizability of results.

3. Identify commonly used basic statistical methods and the circumstances under which their use is appropriate.

4. Understand the notion of sampling variability and sampling distributions.

5. Calculate and interpret confidence intervals and p-values and understand their limitations.
6. Select and carry out an appropriate method of analysis to compare the means or proportions of two or more populations, and provide an interpretation of the results of such an analysis.

7. Conduct simple linear regression analyses, assess their validity, and interpret the results. Understand the extension of these ideas to multiple linear regression.

8. Recognize situations where the opinion of an experienced statistician is required.

Greater emphasis will be placed on conceptual understanding of the material, with relatively less emphasis on computation.

**PREREQUISITE:**

No previous courses in statistics or previous computing experience are required. However, students will be expected to be familiar with algebra (intermediate level) and simple graphing techniques. Further, it will be assumed that you are familiar with the material covered in the module 1 notes.

**“RECOMMENDED” COURSE TEXTBOOK:**

This text provides fairly good explanations for most of the main ideas of the course. Some of the topics will be covered in greater depth during the lectures, tutorials and in the provided set of course notes. Purchase of the textbook is optional. We provide a fairly detailed set of notes for the course, so only purchase the text if you feel like you would like some supplemental material.

**SOME ADDITIONAL REFERENCE TEXTS:**

5. *The Cambridge Dictionary of Statistics in the Medical Sciences* B.S. Everitt

**EQUIPMENT REQUIREMENTS:**

A calculator will be required for examinations. A simple calculator will be sufficient as long is it is able to take logs, exponentiate, etc. It is recommended that you download a copy of R & RStudio for your personal computer and bring your computer to class.
STATISTICAL COMPUTING:

In the course, you are welcome to use any statistical software you like or are familiar with, although R will be the main software used in the course. Lectures will present R code/output, and for exams you will be expected to be familiar with interpreting statistical output from R.

There is a set of video tutorials to teach the use of R. These videos start right from the beginning with installing the software, and assume no familiarity with R or with programming in general. While the video tutorials are general in nature, they are intended to serve this course. You can find the videos by searching “MarinStatsLectures” on YouTube, or by going to the URL listed below. Make sure to subscribe to my YouTube channel (it’s free, you just need a Google account) and to give the videos a “thumbs up” 🍊

http://www.youtube.com/marinstatlectures

COURSE EVALUATION:

Up to 15 Quizzes (with the lowest 2 dropped) 10%
5 Assignments 25%
1 Midterm Test 25%
Final Examination: 40%
* Must pass the final exam to pass the course

LECTURE FORMAT:

Each 1.5 hour lecture will consist of the following: approximately 1 hour of reviewing some course content, and approximately 30 minutes of working through a learning activity, in groups. Rather than spending the entire lecture time reviewing course material and then having you go away and work on problems on your own, the plan is to leave out the very basic stuff from the lectures, and replace that time with some engagement with the material. This will require you to read material prior to lectures, and come to class prepared. This approach has the added benefit of having more contact with the instructors as you work through the more challenging part of the material, rather than having the instructors there for the most basic of the material. This approach will be expanded on further in the first class.

QUIZZES:

The quizzes will be 5 minutes in length, and randomly scattered throughout the lectures. The quiz will be administered at the very beginning of class so please come to class on time. The quiz will be on the basics of the topic to be covered in the given lecture. The intention of them is to give you the incentive to make sure you come to class prepared for the days lecture. These should be “free marks” as long as you are coming to class prepared for the topic. There will be approximately 12-15 of them, and the lowest 2 will be dropped (so that you wont be penalized for things like missing a lecture due to unforeseen circumstances).

ASSIGNMENTS:

The assignments are designed to help students master the concepts presented in class and gain experience in applied data analysis and interpretation, and are formative in nature. Students are encouraged to discuss the assignment and share their ideas, but work must be completed and submitted individually or in pairs. Please do not hand in a piece of work that is identical to
someone else’s...we hate having to deal with things like this!

- We will be working with an online homework system, which will be introduced in class. Many answers will be directly submitted to the system online. Other portions of your assignment will be typed up, saved in a PDF document, and submitted online through the course website.

- Through the online homework system, you will get your own personal set of data that will be worked on over the duration of the course. Your variables will be the same as others, but your actual data and observed values will differ from your classmates.

- Assignments should be typed (or neatly written). This is not a thesis, but it should still look like something you are proud to have your name on. Some marks will be allocated to clarity of presentation.

- Make sure your approach to a problem is clearly outlined and explained, when possible. A clear explanation of what you are doing and why is more important than any numerical answer you provide.

- When preparing solutions related to data analysis, include only those parts of the computer output that are relevant to your answer and highlight or underline the specific items of interest. Alternatively, transcribe those items to another page if you prefer. Do NOT include every piece of information from software output...you must select what is relevant to include.

Dates for assignments are posted on the course schedule. Slight adjustments may be made to the dates, as necessary. Assignments will not be accepted beyond 48 hours of the posted due date, with a penalty of 20% per day late. Extensions will be granted when deemed appropriate, and when requested more than 48 hours before the time the assignment is due.

**MID-TERM TESTS AND FINAL EXAMINATION:**

The midterm test will take place during regular lecture time, and the date is in the course schedule. The final exam will be scheduled for shortly after lectures end. The date will be announced during lecture. Do NOT book flights out of town until a final exam date/time has been confirmed. The goal is to have it one week after the final lecture.

Books may not be used during tests or exams. Students may bring a formula sheet with any relevant formulas or properties written on it. Statistical tables, when necessary, will be provided with exams. More info regarding exams will be provided when exams are nearing.

**COURSE NOTES:**

A set of course notes will be posted on the web for you. You can print or save a copy for yourself. You will be reading these prior to lectures, and may want to bring a copy with you to class. These notes are detailed, and more of a textbook, rather than a set of lecture slides. If you would like to pass these notes on to someone else outside of SPPH, please discuss this with me first.
Course Topics:

The course is broken down into a set of 8 modules. Each module contains ideas that fit together, at least to some extent, and most modules build on the ideas presented in previous modules.

**Modules 1 and the first half of 2 will NOT be covered in lectures.** The notes for modules 1 and part of 2 are provided so that you may refresh on this material, if necessary. Material in modules 1 and 2 will we reviewed in the Stats Prep Course. In SPPH 400, we will begin with the Normal distribution (page 39 of module 2 notes).

**Module 1 – Samples:**

- Summary of univariate data using numerical and graphical methods. Measures of location and dispersion. The standard deviation used as a unit of measurement.
- Summary of bivariate data using graphical methods.
- Methods of sampling and types of bias.
- Data collection and management.

**Module 2 – Probability and Probability Distributions:**

- Probability trees, Bayes’ Theorem. Diagnostic tests: sensitivity, specificity, positive predictive value, negative predictive value, false positive, false negative and prevalence.
- Random variables. Mean and standard deviation of a random variable.
- Common probability distributions for discrete random variables: Binomial and Poisson.
- Linear transformations of random variables, and the properties of the mean and variance
- Introduction to continuous probability distributions. The normal distribution, standardizing, and properties of the normal distribution. Chebychev’s inequality.
- The Central Limit Theorem, and the sampling distribution of a mean/proportion.
- Normal approximation to the Binomial and the Poisson.

**Module 3 – Confidence Intervals and Hypothesis Tests:**

- The role of a sampling distribution in statistical inference
- Student’s t-distribution. Estimation, one and two sided confidence intervals and the underlying logic behind a confidence interval
- One and two-sided hypothesis testing, definition and limitations of p-values.
- Brief mention of Bayesian methods
- Statistical vs. scientific significance
- Types of errors, power and sample size calculations

**Module 4 – Types of Variables and Hypothesis Tests:**

- Definition of bivariate data, outcome and explanatory variables
- Parametric vs. non-parametric tests
- Appropriate statistical methods for the type of outcome variable you want to analyze
Module 5 – Statistical Inference for a Continuous Outcome and Qualitative Explanatory:

- Dependent populations: The paired t-test, repeated measures ANOVA. Non-parametric tests: Wilcoxon signed-rank test, Friedman’s test.
- Brief discussion of two-way ANOVA, and randomized block designs

Module 6 – Statistical Inference for two qualitative variables:

- Analysis of 2x2 tables: The Chi-square test of independence, and Fisher’s exact test.
- McNemar’s test for paired data.
- Measures of association for 2x2 tables: Risk difference and the number needed to treat, relative risk (risk ratio), odds ratios, confidence intervals for odds ratios.
- Brief discussion of the two proportions hypothesis testing

Module 7 – Statistical Inference for two quantitative variables:

- Pearson’s and Spearman’s correlation
- Simple linear regression. Interpretations and tests for model parameters.
- Model assumptions and regression diagnostics

Module 8 – Multiple Linear Regression and Extensions:

- Discussion of multiple linear regression
- The idea of ‘adjusting’ for other variables in a regression model
- Extensions of the linear model for different types of outcome variables (logistic, Poisson and Cox regression)
